
1. Project Overview & Current Status

The Neujin eQMS Phase 1 is a **16-week project** focused on building a secure Base Platform and a Document Management System (DMS).

- **Current Progress:** Approximately **2 weeks** of work have been completed.
 - **Completed Work:** Project foundations (Tech stack), Multi-tenancy architecture, and Database switching strategies.
 - **Tech Stack:** Laravel, Vue, Inertia, and Tailwind CSS, utilizing a custom UI library to prevent external library vulnerabilities.
-

2. The Base Platform: Security & Governance

The system is built for high-compliance environments with strict data isolation.

- **Multi-Tenancy:** Each client has a separate database; users cannot access data from other organizations.
 - **Roles:** Phase 1 uses **fixed roles**: Administrator, Creator, Reviewer, and Viewer.
 - **Electronic Signatures:** Mandatory for critical actions (approvals/submissions) using a 6-digit PIN or password plus a signature image
 - **Encryption at Rest:**
 - **Database Values:** PR/FR/RD content created *in-app* is stored as data and is **encrypted**.
 - **File Artifacts:** Word uploads and generated PDFs are stored in **WORM (Write Once, Read Many)** storage "as-is" without encryption, relying on immutability for integrity.
 - **Audit Trail:** Logs almost all actions (creation, editing, signing, downloading) but **excludes** simple "view/open" events.
-

3. DMS Module: Content Lifecycles

The core of the system manages three distinct types of items:

Item Type	Description	Lifecycle
PR (Procedure)	Controlled docs like SOPs 	Draft → In Review → Effective (Auto-Obsolete old versions) 
FR (Form)	Templates for data entry 	Draft → Approve → Active (Used to create Records) 
RD (Record)	Filled-out instances of FRs 	Draft → Completed/Signed → Archived (Immutable) 

- **Versioning:** PRs and FRs use Major.Minor versioning (e.g., v1.1 $\rightarrow$ v2.0).
 - **Immutability:** Once a Record (RD) is signed, it cannot be edited; errors require a new record.
 - **Numbering:** Sequential IDs are auto-generated based on Department (e.g., PR-QA-01).
-

4. Advanced System Utilities

- **Document Presentation Template (DPT):** Admins can design headers, footers, and watermarks using "tokens" (placeholders like version or date).
 - **Snapshot Binding:** When a document is finalized, its look is "frozen" so future changes to the organization logo or footer don't alter historical records.
 - **Linking:** Users can manually create traceability links between any items (e.g., linking a Record to the SOP that governs it).
 - **Search:** Global and filtered search that respects permissions (e.g., Viewers cannot see obsolete versions).
-

5. Quality Assurance & Acceptance

The project has a rigorous "Evidence-Based" acceptance process.

- **Traceability:** Every **User Story** (the "What") is mapped to a **Test Case** (the "How").
 - **Acceptance Checklist:** Final sign-off requires demonstrating 28+ specific functional items, such as auto-obsolescence and e-sign enforcement.
 - **Evidence Pack:** The team must provide screenshots, screen recordings (MP4), and system logs for every test case executed.
-

6. Explicit Exclusions (Out of Scope)

To avoid "scope creep," the following are **not** included in Phase 1:

- Printing governance or controlled print logs.
- In-app preview of Word files (must download to view).
- Custom Role Designer (fixed roles only).
- Google Drive or external search engine integrations.
